

Agro-morphological characterization of diverse sorghum lines for pre-and post-flowering drought tolerance.

Yves Emendack*, John Burke, Jacob Sanchez, Haydee Echevarria Laza, Chad Hayes.

Supplementary Table 1. Two-year data of agro-morphological characteristics of diverse sorghum lines grown under ideal conditions on Amarillo fine sandy loam soil of Lubbock, Texas.

Lines	[†] HGT (cm)	DTF (days)	TBM (g)	PNA (cm ²)	PWT (g)

[†]PNA; panicle area, PWT; panicle weight, PWD; panicle width, TBM; total biomass, SDM; stem diameter NOL; number of fully developed leaves, PNL; panicle length, PGL; percent green leaves, NGL; number of green leaves, pH; panicle harvest index, NDT; number of nodal tillers, HGT; height, BST; number of basal tillers; and PDL; peduncle length. Bold numbers are characteristics showing strong loading consistently on factor 1 across irrigation treatment.

Supplementary figures

Supplementary Fig 1. Relationship between plant leaf dead ratings and percent green leaves at physiological maturity for diverse sorghum lines subjected to post-anthesis drought stress.

Supplementary Fig 2. PCA factor loading plots and their corresponding score plots with imputations, showing the percent explanation of two selected components and the distribution patterns of agro-morphological characteristics of diverse grain sorghum lines under; (A) control, (B) pre-flowering drought, and (C) postflowering drought irrigation treatments.
